Subject: AASG2025 notification for paper 6
Message-ID: <202503182209.52IM9l8s3031169@easychair.org>

Dear Eric Araujo,

Congratulations! We are pleased to inform you that your paper titled "Modeling Introversion in the Classroom: An Agent-Based Approach" has been accepted for presentation at the Autonomous Agents for Social Good 2025 workshop.

The reviews are available on EasyChair. Please make sure to take into account the reviewers' suggestions as you prepare the camera ready version of your paper and the presentation.

==========
Camera Ready:
==========

The camera-ready submission deadline is on April 30 2025. To upload a new version of the paper, please log into EasyChair.

For the camera ready version, please remove the AAMAS copyright block, citation information and running headers. This can be accomplished by adding the following to your preamble:

\settopmatter{printacmref=false} % Removes citation information below abstract
\renewcommand\footnotetextcopyrightpermission[1]{} % removes footnote with conference information in first column
\pagestyle{plain} % removes running headers

==========
Participation:
==========

We cordially invite you to attend the 24th International Conference on Autonomous Agents and Multiagent Systems (AAMAS 2025) to be held 19–23 May 2025 in Detroit, Michigan, USA.

Registration Information:
https://aamas2025.org/index.php/conference/registration/

Please don't forget to select the AASG workshop when registering for the conference.

Thank you, and we look forward to seeing you in Detroit!

Best regards,
The AASG 2025 Organizing Committee
Panayiotis Danassis
Sanket Shah
Aparna Taneja

SUBMISSION: 6
TITLE: Modeling Introversion in the Classroom: An Agent-Based Approach
AUTHORS: Eric Araujo, Daniel Kwon and Jaden Brookens

---------- REVIEW 1 ----------
SCORE: 0 (borderline paper)
This paper presents the first phases of an ongoing agent-based cognitive modelling of introverted students. There is a detailed discussion of introversion and a formal description of the proposed model, which (to the non-expert eyes of this humble reviewer) looks well-grounded in literature in introversion.

Given the preliminary nature of the work, current original content of the paper is limited to the description of the proposed model. However that description is also very superficial. Specifically, the relatively intricate network in Figure 1 which represents the bulk of the authors' model is not explained in much detail. I would suggest the authors to expand their discussion in a way that details the nodes and connections and their effects in Figure 1, and possibly revise the figure itself as well to visually or textually represent some of these relations if possible. Furthermore, while Sec 5 title reads "Results and Discussion" and at the end of 4 authors say they will present their current results, the last section reads more of a summary without the said results, suggesting that the authors probably forgot to add a section to their paper. Given these issues with presentation, I regard this paper in borderline.

---------- REVIEW 2 ----------
SCORE: 0 (borderline paper)
The authors developed a cognitive model that focus on an agent representing a student in the class. This model helps us understand how psychological factors such as introversion and stress affects the student's learning. The authors provides a comprehensive review of the related works on introversion, motivating the development of the proposed model. In the proposed model, nodes represent characteristics such as introversion level, engagement, and stress, and (directed) edges represent the influence of a characteristic on another. The influence can be either positive or negative. This work provides a concrete first step towards a framework of modeling how psychological factors affect a student's learning.

The authors mention that the proposed model will be fine-tuned using a simulated annealing approach. Could the authors elaborate more on the details of applying simulated annealing to finetune this model? It would also be nice to include empirical results, even if they are preliminary (e.g. with default parameters that are not finetuned).
